KIFAYAH

CUSTOMER SUPPORT KNOWLEDGE BASE

Tier-1 & Tier-2 Resolution Trees • Standard Operating Procedures • Agent Scripts

Document: customer_support_kb.pdf **Version:** 1.0 **Status:** Operational draft

Purpose. This knowledge base provides repeatable workflows for resolving common Kifayah customer issues across the mobile app, website, payment channels and delivery operations. It is designed for agent training and controlled operational use.

Configuration note. Time limits, refund authority, support hours, escalation contacts and system names below are recommended operating standards. Kifayah must approve them, configure them in its actual tools and align them with its published customer policies before agents treat them as binding commitments.

1. Operating Model and Agent Responsibilities

1.1 Tier definitions

Tier	Primary responsibility	Permitted actions	Must escalate when
Tier-1 (T1)	First response, identity/order verification, fact gathering, policy-based resolution and customer updates.	Use approved macros; check order/payment status; request evidence; create tickets; apply only authorised low-value adjustments.	System mismatch, payment reconciliation, food safety concern, repeated complaint, suspected fraud, policy exception or authority limit exceeded.
Tier-2 (T2)	Complex investigation, cross-team coordination, exception review and final operational decision within delegated authority.	Review logs and evidence; coordinate Finance, Store Operations, Delivery, Product/Engineering; approve eligible adjustments within delegated limits.	Legal/regulatory risk, suspected data breach, serious safety incident, high-value loss, unresolved provider dispute or decision beyond delegated authority.

1.2 Universal workflow

1. **Listen and acknowledge:** let the customer explain the issue; use calm, neutral language and avoid blame.
2. **Verify safely:** locate the order using order ID plus an approved secondary check. Never ask for an OTP, password, full card number, CVV, wallet PIN or account login code.
3. **Classify:** select the closest issue category and severity. Record the reported time and the time the agent received the report.
4. **Check evidence and systems:** review order timeline, item/price snapshot, payment reference, delivery events and previous contacts.
5. **Resolve or route:** apply the approved branch below. Do not promise a refund, replacement, credit or delivery time before confirming eligibility and authority.
6. **Confirm in writing:** state what has been done, what happens next, the expected update time and the case reference.
7. **Document and close:** record findings, action, approvals and customer confirmation. Reopen if the customer reports that the issue remains unresolved.

1.3 Severity and response targets (proposed internal targets)

Priority	Examples	Initial response target	Update / escalation target
P1 — Critical	Potential food-safety incident affecting multiple customers; suspected data/security incident; widespread payment/order outage.	Within 15 minutes during staffed support hours	Notify duty lead immediately; continuous updates at agreed intervals.
P2 — High	Payment deducted with no order; perishable goods compromised; order needed urgently and fulfilment blocked.	Within 30 minutes	T1 triage promptly; T2/owning team review target within 2 business hours.
P3 — Normal	Price mismatch; item change request while order still editable; single-item quality complaint without safety concern.	Within 4 business hours	Resolve or provide next update within 1 business day.
P4 — Low	General how-to, feedback, non-urgent account question.	Within 1 business day	Resolve or provide next update within 2 business days.

Targets are internal service goals, not customer guarantees. Apply published policy, applicable law and any stricter approved incident-response standard.

2. Case Intake, Verification and Ticket Standards

2.1 Required ticket fields

- **Customer/order:** customer ID (if available), order ID, registered contact channel, order date/time and delivery area.
- **Issue:** scenario/category, item/SKU, quantity, customer's description, first noticed time and requested outcome.
- **Evidence:** relevant unboxing photos/video, packaging/expiry/batch details, payment transaction reference, app price screenshot or checkout receipt where relevant.
- **System checks:** order status, payment status, item price snapshot, inventory/fulfilment status, delivery event log and provider reference.
- **Resolution:** action taken, adjustment amount, replacement/refund reference, approving agent/lead, owning team, next update deadline and closure reason.

2.2 Evidence and privacy handling

- Ask only for evidence necessary to investigate. Do not ask customers to send payment passwords, OTPs, PINs, CVVs or full card details.
- Use approved secure upload or support channels. Do not save customer photos or payment evidence to a personal device or personal messaging account.
- Restrict access to ticket evidence to staff who need it. Follow Kifayah's retention and deletion schedule.
- Do not alter, crop in a misleading way or publicly share customer evidence. Record if evidence is unavailable and continue with system checks where possible.

2.3 Customer communication standard

Recommended structure: **acknowledgement + action + expectation + reference**. Example: "I'm sorry this happened. I've checked your order and opened case [CASE ID] with our [team]. We'll update you by [time/date]. You do not need to share any OTP or PIN with us."

3. Scenario A — Leaking Milk / Damaged Dairy Package on Unboxing

Objective: protect customer safety, establish whether the item was damaged or compromised on arrival, and provide an authorised remedy without asking the customer to consume or taste questionable food.

3.1 Tier-1 SOP

1. Acknowledge the report and apologise. Ask when the order was delivered and when the leak/damage was first noticed.

2. Confirm order ID, exact dairy product, size, quantity and whether the outer bag or other items were affected.
3. Ask for clear photos of the product, seal/cap, leakage, label/expiry or batch details and delivery packaging if available. Do not require the customer to handle a leaking container unnecessarily.
4. Advise the customer not to consume the product if the seal is broken, packaging is compromised, it appears spoiled, or its safe temperature is uncertain. Keep it separate from other food; follow local safe disposal guidance if it cannot be safely retained.
5. Check delivery timestamp, picking/packing notes, cold-chain or temperature exception logs (if available), rider handover notes and any similar reports for the same batch/route.
6. Check the published return/refund policy and the approved remedy matrix. If the claim is clear and within T1 authority, arrange the approved replacement or refund for the affected item only, plus any directly affected items if policy permits.
7. Create a quality incident ticket, attach evidence securely, record batch/expiry details and inform the customer of the next update.

3.2 Resolution tree

Decision	If YES	If NO / uncertain
Is the item from a Kifayah order and can the order be verified?	Continue to damage and timeline checks.	Ask for order ID/approved verification. If not found, route to T2 for manual lookup; do not reject solely because the customer cannot immediately locate a receipt.
Is there visible leakage, broken seal or damaged packaging?	Treat as a damaged-on-arrival quality claim; do not advise consumption. Verify item and quantity.	If no visible damage, ask about smell/appearance only as a report, not a tasting test; capture details and escalate if safety concern remains.
Was it reported within the published reporting window?	Proceed under the policy remedy path.	Record exact timeline and route to T2 for exception review; do not promise approval or automatically deny.
Is evidence sufficient and does the remedy fall within T1 authority?	Apply approved item-level replacement/refund and document.	Escalate to T2 / Quality Operations with evidence and system checks.
Are there signs of a wider batch, temperature or route issue?	Escalate immediately as P1/P2 quality incident; notify Quality/Store Ops.	Close individual case after remedy and monitoring notes, if no further risk.

3.3 Tier-2 investigation and decision

- Review photos, order timeline, picking/packing records, batch/expiry information, rider handover and temperature-control records where available.
- Check whether other orders from the same batch, store, vehicle or delivery route have similar complaints. Preserve relevant records for investigation.
- Determine likely cause category: supplier/stock condition, storage/cold-chain, picking/packing, transport damage, customer-side post-delivery event, or undetermined.
- Approve a remedy under the current Return and Refund Policy and delegated authority. If a policy window has passed, assess evidence, risk and customer history consistently; document any exception.
- If a food-safety concern is plausible or multiple complaints exist, quarantine remaining stock where operationally possible, notify Quality/Store Operations and follow the incident response plan. Do not let support agents make technical safety declarations.
- Provide a clear outcome and next update. Refer any suspected illness or urgent health concern to appropriate local medical services; support agents must not diagnose or give medical treatment advice.

3.4 Remedy and closure guidance

Finding	Recommended action (subject to approved policy)	Owner
Confirmed damaged/leaking item on arrival	Refund or replace affected unit; include directly damaged items only where policy authorises.	T1 within limit; otherwise T2
Possible temperature/batch issue	Escalate, investigate wider exposure, consider stock hold and customer remedy.	T2 + Quality/Store Ops
Evidence incomplete but report plausible	Request proportionate additional evidence; review system logs; T2 exception review if needed.	T1 then T2
Customer reports illness or wider safety impact	Treat as urgent safety escalation; preserve facts and route to Quality/incident lead.	T2 immediately

Suggested customer wording: “I’m sorry the milk arrived damaged. Please do not consume it if the package or seal is compromised. I’ve recorded the item and delivery details and am arranging a review under our quality policy. Your case reference is [ID]; we’ll update you by [time].”

4. Scenario B — Customer Wants to Add or Remove Items 10 Minutes After Checkout

Objective: determine whether the order is still editable, prevent duplicate charges or fulfilment errors, and clearly explain available options.

4.1 Tier-1 SOP

1. Verify the order and confirm the exact item(s), quantities and requested change. Clarify whether the customer wants to add, remove or replace an item.
2. Check the live order state in the order-management system (OMS): payment state, picking started/completed, packed, dispatched or delivered. Do not use “10 minutes” alone as proof that an order is editable.
3. If order is in an approved editable state, use the OMS edit function only. Recalculate item subtotal, discount eligibility, delivery fee and tax/charges as applicable; show the revised total and obtain customer confirmation before saving.
4. For additions, verify stock and any additional payment required. Use only the approved payment flow; never collect card or wallet credentials in chat.
5. For removals, confirm the revised total and the refund/void route for any amount already paid. Explain that bank/wallet posting times depend on the provider and approved policy.
6. If editing is locked, do not manually promise that the warehouse can stop the order. Check whether cancellation is available under the order state and policy; explain the available choices.
7. Send revised order confirmation or cancellation confirmation and record the customer’s consent and timestamp.

4.2 Resolution tree

Order state	Add item	Remove item
Placed / payment pending; OMS edit enabled	Check stock and price; obtain consent; update order; recalculate payment or total.	Remove line; recalculate total; ensure any authorisation/payment adjustment is correctly recorded.
Payment confirmed; not yet picking; edit enabled	Add only through OMS; request incremental payment if system supports it.	Remove line and trigger approved partial refund/void; do not issue manual off-system payment.
Picking started or edit locked	Do not promise addition. Check approved cancellation/reorder option or offer a separate new order.	Check whether picker can safely stop/remove line via controlled exception; otherwise explain cancellation/return options.
Packed / handed to delivery partner / out for delivery	No add-on to original order. Offer a separate order if serviceable and clearly disclose separate fees/slot.	Do not instruct rider to alter sealed order or collect an informal cash adjustment. Route any cancellation exception to T2/Operations.
Delivered	Treat as a new order or post-delivery issue; use return/refund policy where applicable.	Do not edit historical order; assess as return/refund request under policy.

4.3 Tier-2 / Operations escalation

- Use T2 when OMS status conflicts with warehouse/rider status, an edit is locked despite no fulfilment activity, or a customer-impacting exception is requested.
- T2 confirms with Store Operations whether a safe, traceable edit is possible. Any manual override must be authorised, logged and reflected in the customer's final order record.
- Finance reviews any payment delta, partial capture, void or refund exception. Support must not create a duplicate charge to compensate for an OMS issue.
- If the order cannot be changed, T2 may authorise cancellation only where the operational state and published cancellation policy permit it. State the refund route and expected processing window without guaranteeing bank posting time.

4.4 Control checks

- Never edit an order without explicit customer consent to the revised items and total.
- Never add a product that is out of stock, restricted, or not supported by the live fulfilment system.
- Keep original and revised order totals in the audit trail.
- Do not tell customers to pay a rider directly for an add-on or refund.
- Where a separate order is placed, explain that it may have a separate delivery fee and delivery window.

Suggested customer wording: "I can check whether your order is still editable. Changes depend on its live picking and dispatch status, not just the time since checkout. Please tell me the item and quantity you'd like to change; I'll confirm the revised total before making any update."

5. Scenario C — Easypaisa Deducted Payment but Order Status Is Pending

Objective: prevent duplicate payment, reconcile the provider transaction with Kifayah's order record and communicate a confirmed outcome.

5.1 Immediate customer protection

Tell the customer not to pay again or place a duplicate order until the first transaction has been checked. Do not ask for an OTP, wallet PIN, password, CVV or full account credentials. Request only the transaction reference/receipt details needed for reconciliation.

5.2 Tier-1 SOP

1. Verify order ID, amount, payment method, approximate transaction time and registered mobile number through approved verification.
2. Ask for the Easypaisa transaction ID/reference, amount, timestamp and a receipt screenshot with sensitive information masked. Never request wallet PIN, OTP or login credentials.
3. Check Kifayah payment dashboard/OMS: order payment state, gateway callback status, provider reference, duplicate transaction records and order creation timestamp.
4. Classify the case: (a) payment successful and order pending; (b) payment pending/processing; (c) payment failed/reversed; (d) no matching transaction; or (e) duplicate debit.
5. If the dashboard shows successful payment but OMS remains pending, do not ask customer to pay again. Create a payment reconciliation ticket and escalate to T2/Finance.
6. If the provider shows pending/processing, explain that confirmation is awaited and give the approved next update time. Do not claim that the money is lost or guaranteed to return.
7. If failed/reversed is confirmed, explain the system result and advise the customer to check the wallet statement. If the customer still sees a debit, escalate with reference evidence to Finance/provider support.
8. Send the ticket reference and update commitment. Keep the case open until order status or payment outcome is confirmed.

5.3 Resolution tree

System/provider finding	Agent action	Escalation / closure
Kifayah gateway record = success; OMS = pending	Do not request another payment. Check whether a safe authorised order-state refresh/reconciliation action exists.	T2 + Finance; reconcile payment to original order; close only when order/refund status is confirmed.
Gateway and provider both = pending/unknown	Record provider reference and time; advise customer not to retry yet; monitor via approved process.	T2/Finance contacts provider through merchant channel; give customer scheduled update.
Provider = failed/reversed; customer statement shows debit	Capture transaction reference and masked receipt; do not promise immediate reversal.	Finance/provider reconciliation; explain provider/bank posting may take time.
No transaction match found	Recheck amount, date/time, reference and payment channel; avoid repeated credential requests.	T2/Finance manual lookup; do not create a second payment request until first attempt is resolved.
Two successful debits for one order	Record both references; ensure no further payment attempt.	P2 escalation to Finance; verify duplicate capture and arrange approved reversal/refund.
Payment confirmed and order can be fulfilled	T2/Finance authorises payment reconciliation and OMS correction; fulfilment proceeds only after valid confirmation.	Notify customer that payment is matched and provide updated order status.
Payment cannot be matched or order cannot be fulfilled	Finance determines settlement/reversal path and confirms evidence.	Refund/reversal via original payment route where possible; keep case open until confirmation.

5.4 Tier-2 / Finance SOP

- Match transaction reference, amount, merchant account, timestamp and provider status against gateway settlement reports and Kifayah order/payment records.
- Check asynchronous webhook/callback logs, signature validation result, retry history, idempotency key, timeout/error codes and any manual status changes. Do not expose technical secrets or credentials in the customer ticket.
- Determine whether funds were captured, authorised, pending, reversed or settled. A customer-side debit notification alone is not sufficient proof of merchant settlement, but it must be investigated.
- If captured and attributable to the order, reconcile against the original order ID; do not create a duplicate order unless the customer explicitly requests it after the first case is resolved.
- If funds were captured but fulfilment cannot proceed, initiate the approved refund/reversal to the original payment method where supported. Record the refund reference and provider-confirmed status.
- If provider confirmation is required, raise a merchant-side query through Kifayah's authorised Easypaisa channel. Track provider case ID and next follow-up date.
- Escalate repeated callback failures or multiple affected customers to Payments Engineering/Incident Lead. Preserve logs and quantify scope.

5.5 Customer update template

"Thanks for sharing the transaction reference. Our records show that your order payment is being reconciled. Please do not make another payment for this order while we check it. Your case number is [ID]. We will update you by [time/date]. Any reversal or refund timing depends on confirmation from the payment provider."

6. Scenario D — Incorrect Price Billed vs. Displayed App Price

Objective: establish which price was displayed at the time of checkout, correct any billing error, and preserve a transparent audit trail.

6.1 Tier-1 SOP

1 Ask for order ID, product name/SKU, billed unit price, quantity and the price the customer expected. Request a screenshot only if needed; check the app's stored price snapshot first.

2. Compare the product detail/listing price, cart price, checkout summary, order line-item snapshot and final invoice. Check timestamp, variant, pack size, weight, promotion eligibility and delivery/tax line items.
3. Determine whether the difference is a product-price mismatch, promotion not applied, variable-weight adjustment, delivery fee, tax/charge, or display/cache issue.
4. If the billed item price differs from the confirmed checkout/order price and the case is within T1 adjustment authority, apply the approved correction/refund for the difference and send an updated receipt.
5. If the displayed price was conditional (e.g., selected size, membership, coupon, minimum basket or limited-time offer), explain the condition clearly and provide evidence from the applicable terms. Do not dismiss the complaint without checking the order snapshot.
6. If the system records conflict or the amount exceeds T1 authority, escalate to T2/Pricing and Finance. Do not manually edit a historical invoice without an auditable correction.

6.2 Resolution tree

Finding	Action	Owner
Order snapshot confirms lower checkout price than charged	Correct the difference through approved refund/credit process; correct invoice/order record if supported.	T1 within limit; otherwise T2/Finance
Listing price changed before checkout and checkout price was clearly shown and accepted	Explain the timestamped checkout price and share breakdown; escalate if display may have been misleading.	T1; T2 if disputed
Coupon/offer condition not met	Explain the exact condition and verify whether the app correctly communicated it; correct if system misapplied offer.	T1; Pricing T2 for rule defect
Wrong pack size/variant selected or billed	Compare SKU/variant and item received; remedy under product/order policy if fulfilment error.	T1 then Store Ops/T2
Variable-weight final amount differs from estimate	Check disclosed rate, actual weight, tolerance and final calculation; correct any calculation or disclosure error.	T1; T2/Finance if mismatch
Delivery fee, tax or other charge mistaken for item price	Provide itemised bill and identify each line; correct only if the charge was not disclosed or was incorrectly applied.	T1; Finance/Pricing T2
App cache or price propagation defect	Capture device/app version, SKU, timestamp and screenshots; avoid asking customer to reinstall as the only response.	T2 + Product/Engineering

6.3 Tier-2 / Pricing and Finance SOP

- Retrieve the price history and effective timestamps for the relevant SKU, variant, location and promotion. Compare the displayed price at browse, cart and checkout where logs are available.
- Check price synchronisation between catalogue, cart, OMS, POS/warehouse and payment capture. Identify whether the mismatch arose before checkout, during order creation or during payment settlement.
- Recalculate the expected total from the approved price, quantity, discount, delivery fee and applicable taxes/charges. Record the calculation in the ticket.
- If Kifayah charged more than the confirmed checkout amount, arrange the difference refund/credit using the approved payment route and notify Finance if settlement reconciliation is needed.
- If the checkout price was correctly displayed and accepted, explain the timestamped breakdown in plain language. Escalate to Pricing if the listing or promotional wording could reasonably have misled the customer.
- Open a defect with Product/Engineering for recurring or multi-customer discrepancies. Include affected SKU(s), location, app version, timestamps, screenshots, order IDs and estimated customer impact.
- Do not silently change the order history or delete evidence. Preserve original and corrected values in the audit trail.

6.4 Customer wording

> “I’ll compare the price shown at checkout with the amount on your order receipt. If the amount charged is higher than the confirmed checkout total, we’ll correct the difference through the approved payment process. Your case reference is [ID].”

7. Escalation Matrix and Ownership

Issue / trigger	Primary owner	T2 action	Escalation path
Leaking/damaged dairy; possible batch or cold-chain concern	Quality / Store Operations	Investigate batch, storage, packing and route; assess stock hold and customer remedy.	Quality Lead → Operations Manager / Incident Lead
Order edit conflict or dispatch already started	Store Operations / OMS Support	Confirm physical status; approve controlled exception or explain unavailable change.	Operations Lead → Product/Engineering if OMS defect
Easypaisa debit / pending order / duplicate debit	Finance / Payments	Reconcile gateway, provider and OMS; arrange approved reversal/refund or order correction.	Finance Lead → Payment Provider / Engineering
Incorrect item price or checkout total	Pricing / Finance	Compare timestamped price records; calculate adjustment; raise pricing defect.	Pricing Lead → Finance / Product
Suspected fraud, account takeover or data exposure	Security / Privacy Officer	Restrict access if necessary; preserve evidence; follow incident response.	Security Lead / Privacy Officer immediately
Legal threat, regulator complaint or injury allegation	Legal / Compliance / Incident Lead	Preserve records; do not speculate or admit legal liability; provide factual acknowledgement.	Legal Counsel / Senior Management

8. Refund, Replacement and Adjustment Controls

- Only use approved refund, replacement, wallet-credit or price-adjustment functions. Never refund to a personal account, personal wallet or a payment destination supplied informally in chat.
- Verify the original transaction and the correct beneficiary before initiating any refund. Use the original payment method where supported and required by policy.
- Follow Kifayah's current Return and Refund Policy and delegated approval matrix. If the policy or system does not specify an amount/limit, escalate rather than inventing one.
- Record gross amount, adjustment amount, currency (PKR), reason code, order ID, transaction/refund reference and approver.
- Do not promise a bank or wallet posting date that Kifayah cannot control. Give the approved processing estimate and explain that provider posting times may vary.
- Monitor failed refunds and returned transactions to confirmed completion. A refund marked "initiated" is not the same as a provider-confirmed completed refund.

9. Quality Assurance, Coaching and Knowledge Maintenance

9.1 QA scorecard

Quality dimension	What good looks like
Verification & privacy	Correct order verification; no request for OTP/PIN/password/full card details; minimum necessary evidence.
Diagnosis	Correct scenario classification; relevant system checks completed; no assumptions based solely on customer wording.
Policy compliance	Remedy matches current policy and delegated authority; no unauthorised promise or manual workaround.
Ownership & communication	Clear acknowledgement, next step, update deadline and case reference; customer not asked to repeat information unnecessarily.
Documentation	Complete timeline, evidence, findings, approvals, adjustment references and closure code.
Resolution quality	Issue resolved or correctly escalated; customer receives accurate outcome and next update.

9.2 Suggested case closure codes

- QUALITY_DAMAGED_ON_ARRIVAL; QUALITY_ESCALATED_BATCH; ORDER_EDIT_COMPLETED; ORDER_EDIT_UNAVAILABLE; PAYMENT_RECONCILED; PAYMENT_REVERSAL_PENDING; DUPLICATE_PAYMENT; PRICE_ADJUSTED; PRICE_CONFIRMED; TECHNICAL_DEFECT_ESCALATED; CUSTOMER_WITHDREW; UNRESOLVED_ESCALATED.

9.3 Knowledge-base governance

- Assign a named owner in Customer Support Operations and a reviewer in Quality, Finance and Legal for the relevant sections.
- Review monthly during launch and after every material change to payment providers, order-management workflows, refund policy or delivery operations.
- Version-control all changes. Remove outdated macros and ensure agents can access only the currently approved policy.
- Use anonymised case trends for coaching. Do not include unnecessary personal data in training examples.
- Run scenario drills for the four cases in this document and test the escalation contacts before launch.

10. Agent Quick Reference

Customer says…	First action	Never do this
“Milk leaked in the bag.”	Apologise; advise not to consume compromised product; verify order and capture photos/batch details.	Do not ask customer to taste it or dispose of all evidence before recording details.
“Add/remove this item; I checked out 10 minutes ago.”	Check live OMS state and edit eligibility; confirm revised total and obtain consent.	Do not assume the order is editable based only on elapsed time.
“Easypaisa deducted money but order is pending.”	Capture transaction reference; check gateway/OMS; tell customer not to pay again yet.	Do not request OTP/PIN or ask customer to make a second payment.
“The app showed a lower price.”	Compare timestamped checkout snapshot, invoice and price/offer rules.	Do not rely only on today’s catalogue price or silently alter the order record.

Operational disclaimer: This knowledge base is an internal SOP template. Kifayah must configure its actual OMS, payment dashboard, approval limits, response targets, refund rules, support hours and escalation contacts before deployment. In case of conflict, applicable law, the currently approved customer-facing policies and an authorised incident command decision take precedence.
